

Executive Summary

Management Brief: Retention Strategy Recommendations

Prepared by: Harendra

MBA (Business Analytics)

Focus: Business Analytics | Finance & Operations

2026

Executive Summary

This executive brief summarizes the final customer-retention analysis conducted on 10,000 banking customer records. The analysis focuses on engagement, product utilization, financial value and relationship strength to identify customers who require proactive retention, reactivation or cross-sell action.

At-a-Glance KPIs

KPI	Result	Interpretation
Total customers	10,000	Customer base analyzed
Overall churn	20.37%	Baseline retention risk
Active customer churn	14.27%	Lower observed churn
Inactive customer churn	26.85%	12.58 pp above active customers
High-value disengaged customers	1,247	Priority premium-retention population
High-value disengaged churn	30.47%	Elevated observed churn
Two-product churn	7.58%	Lowest major product-count churn rate

What the Analysis Says

1. Engagement is an early-warning signal. Inactive customers show 26.85% observed churn compared with 14.27% among active customers.
2. Product depth is useful but non-linear. One-product customers show 27.71% churn, two-product customers 7.58%, while 3–4 product customers show unusually high rates that require investigation.
3. High financial value does not guarantee loyalty. The 1,247 high-value disengaged customers show 30.47% observed churn.
4. The Relationship Strength Index is directionally aligned with retention, creating a practical framework for customer-level prioritization.

Recommended Actions

Priority	Action	Why it matters
1	Premium retention watchlist	Protect high-value customers whose engagement has weakened.
2	Engagement reactivation	Target inactive customers before churn becomes irreversible.
3	Need-based cross-sell	Deepen relationships for active single-product customers without indiscriminate selling.
4	Investigate 3–4 product anomaly	Determine whether extreme churn reflects product complexity, customer experience or small-sample instability.
5	Risk-based resource allocation	Prioritize retention resources using observed risk rather than one-size-fits-all campaigns.

Decision Framework

Strong Relationship → Maintain and reward. Growth Opportunity → Need-based cross-sell. Disengaged → Reactivate. At-Risk Premium → Priority intervention. Complex / Investigate → Root-cause analysis before intervention.

Management Caveat

These findings are observational and should be interpreted as associations. The 3–4 product segments are relatively small and show unusually high observed churn; operational decisions should validate the underlying product combinations, customer experience and data quality before applying broad policy changes.
